Jaxer Guide

- Introduction
- Setup
- Develop
- Debug

Send Email

Send an email in only two steps:

- create an instance of [Jaxer.SMTP.MailMessage](#)
- send the message with [Jaxer.SMTP.sendMessage\(\)](#)

API Links

[Jaxer.SMTP](#)
[Jaxer.SMTP.MailMessage](#)

Send an email in one step:

- send the message with [Jaxer.SMTP.sendEmail\(\)](#)

The signature of [Jaxer.SMTP.sendEmail\(\)](#) is the same as the example function which follows this section. Generally, you'll use the two step approach over the one step when you want to create and manipulate the mail message object before sending it off, or when you want to keep the mail message object around for other purposes.

Sending an Email Message

```

01.  /*****
02.  Params:
03.
04.  - server: string, mail server to connect to
05.  - port: number, port on mail server to connect to
06.  - from: string, proper email address
07.  - to: string or array of strings, proper email addresses
08.  - subject: string, subject of message to be sent
09.  - body: string, body of message to be sent
10.  - headers: array of array of strings, each header to be sent being an array of the form
11.  ← ['header name', 'value']
12.  *****/
13.
14.  function sendAMessage(server, port, from, to, subject, body, headers) {
15.
16.      if(!port) {
17.          port = Jaxer.SMTP.DEFAULT_PORT;
18.      }
19.      var message = new Jaxer.SMTP.MailMessage();
20.      message.setFrom(from);
21.      message.addRecipient(to);
22.      message.setSubject(subject);
23.      message.setBody(body);
24.      message.extraHeaders(headers);
25.      try {
26.          Jaxer.SMTP.sendMessage(server, port, message);
27.      } catch (e) {
28.          return e.toString();
29.      }
30.      return true;
  
```

Jaxer does not currently send emails with attachments.

Bundled Example

A complete, runnable example of sending email resides in the Jaxer samples folder:

Aptana_Jaxer/jaxer/aptana/samples/smtp-email/

If you have Jaxer installed on your system, you can [run](#) the example.
